```
The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                  /label= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes peptides of amino acid sequence (I) and their abstract. (I) are useful as platelet aggregation inhibitores and are easily absorbed by the body. Due to the presence of the N-terminal guandidno or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        - contain

                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                     The invention describes peptides of amino acid sequence (I) and their states. It is are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal quanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Therasfter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                           New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New RGD peptide(s) useful as anti:platelet aggregation agents - contain

The invention describes peptides of amino acid sequence (1) and their salts. (1) are useful as platelet aggregation inhibitores and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (1) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity; can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with escellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                           New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                       /label= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised metabolised ackpelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 - contain

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guandidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                               platelet aggregation inhibitor; guanidino group; amidino group.

                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                           salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                        New RGD peptide(8) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                The invention describes peptides of amino acid sequence (I) and their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                           New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New RGD peptide(s) useful as anti-platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                   The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                               New RGD peptide (s) useful as anti-platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.

Bacteriol. 172:679-6802 (1990).

Bacteriol. 302-6802 (1990).

FUNCTION: Acyl-protein synthetase activates tetradecanoic acid. It is a component of the fatty acid reductase complex responsible for converting tetradecanoic acid to the aldehyde which serves as substrate in the luciferase-catalyzed reaction.

- CATALYTIC ACTIVITY: ATP + an acid + protein = AMP + diphosphate + an acyl-protein thiolester.

- PATHWAY: Bioluminescent fatty acid reduction system; second step.

- SIMILARITY: Belongs to the luxE family.
                                                                                                                                                                                                                                                      01-MAR-1992 (Rel. 21, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
        "Growth-modulating serum tripeptide is glycyl-histidyl-lysine.";
Experientia 33:324-325(1977).
-!- MISCELLANBOUS: This serum tripeptide has been found to stimular
growth of some cell types and to inhibit other types in vitro.
GO; GO:0001558; P:regulation of cell growth; NAS.

J. Pept. Protein Res. 39:258-264(1992).
-1- FUNCTION: Neuroexcitatory peptide; increases the impulse frequency and produces a spike broadening of the identified heart excitatory neuron (PON); also enhances the amplitude and frequency of the heart beat. Has also an effect on several other muscles.

MEDLINE=93391436; PubMed=8397415;
McFarlane I.D., Hudman D., Nochacker H.-P., Grimmelikhuijzen C.J.P.;
"The expansion behaviour of sea anemones may be coordinated by two inhibitory neuropeptides, Antho-KAamide and Antho-Klamide.";
Proc. R. Soc. Lond., B, Biol. Sci. 253:183-188(1993).
-!- FUNCTION: Inhibits spontaneous contractions in several muscle proups. May be involved in the expansion phase of feeding behaviour in sea anemones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=92195954; PubMed=1686933;

Bvans B.D., Pohl J., Kartsonis M.A., Calabrese R.L.;

Tidentification of RPamide neuropeptides in the medicinal leech.";

Peptides 12:897-908(1991).

-1- SUBCELLULAR LOCATION: Secreted.

-1- SIMILARITY: Belongs to the FARP (FMRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nothacker H.-P., Rinehart K.L. Natl. Acad. Sci. U.S.A. 72:4123-4127(1975).

-I- MISCELLANEOUS: These peptides are released from mast cells in lung (and other tissues) during hypersensitivity reactions (anaphylaxis). Their activities, preferentially affecting eosinophils, include chemotaxis, chemotactic deactivation, release of enzymes, and stimulation of the hexose monophosphate shunt.

        Peptides 15:31-36 (1994).

-!- FUNCTION: Myoactive; cardioexcitatory substance. Pharmacological activities include augmentation, induction, and regularization of cardiac contraction.

-!- SUBCELMULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the PARP (FWRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDINE=92270459; PubMed=1821096;

(I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /label= OTHER

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /label= OTHER

(I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes peptides of amino acid sequence (I) and their salts. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /label= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                           The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                           New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New RGD peptide(s) useful as anti:platelet aggregation agents - contain

```

Length 1;

```
New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                        /label= OTHER
/note= "OTHER= H2NC(=NH)NH(CH2)CO. Beta-Ala (not
defined)"
                               platelet aggregation inhibitor; guanidino group; amidino group.
          Platelet aggregation inhibitor peptide #137.
                                                                                                                                                                                                                                                                                                     Disclosure; Page 10; 34pp; Japanese

            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                         New RGD peptide (s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes peptides of amino acid sequence (I) and their

The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /label= OTHER

The invention describes peptides of amino acid sequence (1) and their salts. (1) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (1) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                            /label= OTHER

                                                                                                                                                                                                                                                                           ઠ
                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                           The invention describes peptides of amino acid sequence (I) and their abstract. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanidino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
                                                                                                                                    New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                - contain

                                                                                                                                                                                The invention describes peptides of amino acid sequence (I) and their salts. (I) are useful as platelet aggregation inhibitors and are easily absorbed by the body. Due to the presence of the N-terminal guanddino or amidino group, (I) are provided with excellent stability so that their activity can be exhibited for an effective time after administration. Thereafter they are readily metabolised and expelled. This is the amino acid sequence of a platelet aggregation inhibitor peptide.
New RGD peptide(s) useful as anti:platelet aggregation agents - contain guanidino or amidino gp. at N-terminal to increase stability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gapa
